Rapid Methods and Automation in Microbiology and Immunology Antti Vaheri,Richard C. Tilton,Albert Balows,2012-12-06

The current diagnostic methods for the great variety of microbial agents affecting health are clearly unsatisfactory. New important pathogens have emerged including the agent responsible for bovine spongiform encephalopathy. Moreover, there is an increasing need for more accurate microbial control of our environment, and of the food and water we consume. What is needed are rapid, sensitive and reliable procedures which, on the one hand, should be suitable for automation and, on the other hand, presented in a cost-effective version suitable for field use. Including new biochemical approaches, such as polymerase chain reaction, recombinant gene products and synthetic peptides, these needs are discussed in these protocols of the RAMI-90 congress.

Immunology of Silicones Michael Potter,Noel Rose,2012-12-06 This issue of Current Topics in Microbiology and

Immunology records the proceedings of a Workshop on the Immunology of Silicones held at the Natcher Conference Center, National Institutes of Health, Bethesda, Maryland, March 13 and 14, 1995. A large number of investigators from North America and Europe met to discuss available data on how the immune system responds to silicones and related materials. Some aspects of this field are controversial. Nonetheless, the meeting was marked by a civil and open exchange of scientific information and divergent interpretations, reflecting the traditions of scientific communication. Each invited participant was asked to submit an article summarizing his/her presentation. Most of the papers are published as submitted, with only editorial changes to conform with the guide lines given to each contributor or revisions to clarify aspects of the paper. The papers should not be regarded as peer-reviewed publications. This preface will attempt to outline some of the immunological areas of investigation relating to silicones.

One Health: The Human-Animal-Environment Interfaces in Emerging Infectious Diseases John S. Mackenzie, Martyn Jeggo, Peter Daszak, Juergen A. Richt, 2013-11-22 One Health is an emerging concept that aims to bring together human, animal, and environmental health. Achieving harmonized approaches for disease detection and prevention is difficult because traditional boundaries of medical and veterinary practice must be crossed. In the 19th and early 20th centuries this was not the case—then researchers like Louis Pasteur and Robert Koch and physicians like William Osler and Rudolph Virchow crossed the boundaries between animal and human health. More recently Calvin Schwabe revised the concept of One Medicine. This was critical for the advancement of the field of epidemiology, especially as applied to zoonotic diseases. The future of One Health is at a crossroads with a need to more clearly define its boundaries and demonstrate its benefits. Interestingly the greatest acceptance of One Health is seen in the developing world where it is having significant impacts on control of infectious diseases.

Fitzpatrick, 2011-10-17 *Microbiology* is one of the core subjects for veterinary students, and since its first publication in 2002, *Veterinary Microbiology and Microbial Disease* has become an essential text for students of veterinary medicine. Fully revised and expanded, this new edition updates the subject for pre-clinical and clinical veterinary students in a comprehensive manner. Individual sections deal with bacteriology, mycology and virology. Written by an academic team with many years of teaching experience, the book provides concise descriptions of groups of microorganisms and the diseases which they cause. Microbial pathogens are discussed in separate chapters which provide information on the more important features of each microorganism and its role in the pathogenesis of diseases of animals. The international and public health significance of these pathogens are reviewed comprehensively. The final section is concerned with the host and is organized according to the body system affected. Tables, boxes and flow diagrams provide information in an easily assimilated format. This edition contains new chapters on molecular diagnostics and on infectious conditions of the skin, cardiovascular system, urinary tract and musculoskeletal system. Many new colour diagrams are incorporated into this edition and each chapter has been updated. Key features of this edition: Twelve new chapters included Numerous new illustrations Each chapter has been updated Completely re-designed in full colour Fulfills the needs of veterinary students and academics in veterinary microbiology Companion website with figures from the book as Powerpoints for viewing or downloading by chapter: www.wiley.com/go/quinn/veterinarymicrobiology *Veterinary Microbiology and Microbial Disease* remains indispensable for all those studying and teaching this essential component of the veterinary curriculum.

Bacterial Invasion of Host Cells Richard J. Lamont, 2004-03-29 This book concerns the intimate association between bacteria and host cells. Many bacterial pathogens are able to invade and survive within cells at mucosal membranes. Remarkably, the bacteria themselves orchestrate this process through the exploitation of host cellular signal transduction pathways. Intracellular invasion can lead to disruption of host tissue integrity and perturbation of the immune system. An understanding of the molecular basis of bacterial invasion and of host cell adaptation to intracellular bacteria will provide fundamental insights into the pathophysiology of bacteria and the cell biology of the host. The book details specific examples of bacteria that are masters of manipulation of eukaryotic cell signaling and relates these events to the broader context of host-pathogen interaction. Written by experts in the field, this book will be of interest to researchers and graduate students in microbiology, immunology, biochemistry, as well as molecular medicine and dentistry.

Origin and Evolution of the Vertebrate Immune System L. Du Pasquier, G.W. Litman, 2012-12-06 The comparative approach to immunology can be traced to the era of Pasteur and Metchnikov in which observations regarding foreign recognition in invertebrates was a factor in the development of the principal concepts that created the foundation of what now is the broad field of immunology. With each major experimental and conceptual breakthrough, the classical, albeit essential, question has been asked are the immune systems of phylogenetically primitive vertebrates and invertebrates similar to that of mammals? Somewhat surprisingly for the jawed vertebrates, the general answer has been a qualified form of yes, whereas for agnathans and invertebrate phyla it has been no so far. The apparent abruptness in the appearance of the immune system of vertebrates is linked to the introduction of the somatic generation of the diversity of its antigen specific receptors. Therefore the questions regarding the origin and evolution of the specific immune system revolve around this

phenomenon. With respect to the origin of the system (aside from the origin of the rearranging machinery itself, the study of which is still in its infancy) one can ask questions about the cellular and molecular contexts in which the mechanism was introduced.

Advanced Techniques in Diagnostic Microbiology Yi-Wei Tang, Charles W. Stratton, 2018-11-09 In recent years, advanced molecular techniques in diagnostic microbiology have been revolutionizing the practice of clinical microbiology in the hospital setting. Molecular diagnostic testing in general and nucleic acid-based amplification methods in particular have been heralded as diagnostic tools for the new millennium. This third edition covers not only the most recent updates and advances, but details newly invented omic techniques, such as next generation sequencing. It is divided into two distinct volumes, with Volume 1 describing the techniques, and Volume 2 addressing their applications in the field. In addition, both volumes focus more so on the clinical relevance of the test results generated by these techniques than previous editions.

The BALB/c Mouse Michael Potter, 2011-12-06 The mouse was first used in immunological research by Paul Ehrlich in 1891 in an extraordinary series of experiments on the maternal transfer of antitoxic immunity. A short 22 years later in 1913 Halsey Bagg acquired a stock of albino mice from a commercial dealer and used them in a series of experiments on learning. Because he was interested in the genetics of intelligence, Halsey Bagg began breeding a pedigreed line of these mice that were subsequently named for him - Bagg Albino. Though Halsey Bagg is not credited with initiating the inbred strains of mice, his stock curiously has played an indisputably important role. Bagg Albinos were progenitors of the present day BALB/c family of sublines - the subject of this book. They were also used as one of the parents in the development of inbred strains A, CBA and C3H, three other very famous strains. Today the BALB/c mouse is among the five most widely used inbred strains in biomedical research and a particular favorite in immunology and infectious disease research. The hallmark of the BALB/c response to so many kinds of infections is susceptibility and sometimes an exaggerated susceptibility, but this paradoxically is not associated with immunodeficiency as BALB/c is an excellent responder to immunization. These characteristics have made the BALB/c mouse a model for identifying genes that determine susceptibility to infectious and neoplastic diseases. In

1985 the laboratory BALB/c mouse became 72 years old. The current filial generations are somewhere around 350 generations [MURPHY].
